

INTEDEX

Data Harmonisation for SAP R/3

It may be interesting to know that if you were to sit on the planet Neptune, the Sun itself would be the size of the full stop at the end of this sentence. If the Sun was to be drawn the size of a pea, Neptune would be 14km off the page. So far removed that it would be hard to consider what effect the Sun could possibly have on Neptune. But the Sun keeps Neptune in its orbit.

SAP systems are similar. They start off with a big bang, but as time goes on Dev and Qa orbit further and further away from Production until the gaps in data are so vast that they are no longer in orbit and not longer relevant.

An ever increasing amount of effort and resources are needed to keep these systems relevant. Effort costing time and money.

Intedex remedies this by revitalizing the data on each support systems, drawing them back into your planetary system by making the data relevant. Ensuring that your support systems once again add value, minimize risk and support the teams that depend on them. Intedex can rebuild systems while keeping configuration and programs intact, ensuring that system settings remain unchanged and that User Login and Authorisation Data remain consistent.

INTEDEX copies data between SAP systems. Only data that you need is synchronised, allowing you to manage your systems more effectively. Differentiating between master data and transaction data, Industry-Solutions and Custom Development. Intedex can even specify a slice of data to be refreshed. 80% of the time you only need Master data that is rarely larger than 20% of your data. Master data that can be refreshed in minutes.

SPECIAL INTEREST POINTS

- EASY SYSTEM REBUILD
- REVIVE DEV AND QA FROM PRD
- NO HARDWARE REQUIREMENTS
- SLICE PORTIONS OF DATA

If you lose a week each month rebuilding QA or only rebuild DEV once a year, then you should be using INTEDEX.
